1 CAVI for Earth quakes

1.1 Question 1.1

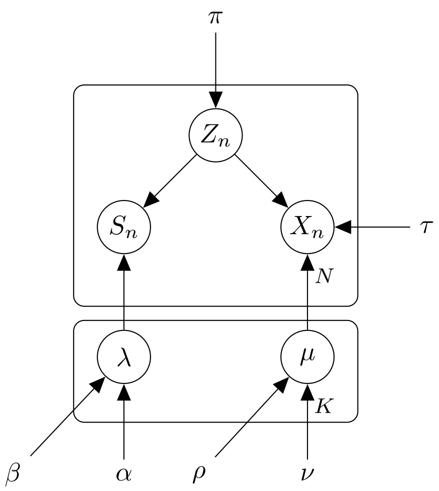

Figure 1: Directed Graphical Model for the Earthquake problem

1.2 Question 1.2

Let us take the Alternative 1 in 2D. Here, we know these distributions:

- $p(Z_n|\pi) = Categorical(\pi)$
- $p(S_n|Z_n = k, \lambda_k) = Poisson(\lambda_k)$
- $p(X_n|Z_n = k, \mu_k, \tau) = Normal(\mu_k, \tau \cdot I)$
- $p(\mu_k|\nu, \rho) = Normal(\nu, \rho \cdot I)$
- $p(\lambda_k|\alpha, \beta) = Gamma(\alpha, \beta)$

Where, ρ and τ define precision and not standard variation. Then we have:

$$\begin{aligned}
\log p(X, S, Z, \lambda, \mu|\pi, \tau, \alpha, \beta, \nu, \rho) &= \log p(X|S, Z, \lambda, \mu, \pi, \tau, \alpha, \beta, \nu, \rho) \\
&\quad + \log p(S, Z, \lambda, \mu|\pi, \alpha, \beta, \nu, \rho) \\
&= \log p(X|Z, \mu, \tau) + \log p(S|Z, \lambda, \mu, \pi, \alpha, \beta, \nu, \rho) \\
&\quad + \log p(Z, \lambda, \mu|\pi\alpha, \beta, \nu, \rho) \\
&= \log p(X|Z, \mu, \tau) + \log p(S|Z, \lambda) + \log p(Z|\pi) \\
&\quad + \log p(\lambda, \mu|\alpha, \beta, \nu, \rho) \\
\log p(X, S, Z, \lambda, \mu|\pi, \tau, \alpha, \beta, \nu, \rho) &= \log p(X|Z, \mu, \tau) + \log p(S|Z, \lambda) + \log p(Z|\pi) \\
&\quad + \log p(\mu|\nu, \rho) + \log p(\lambda|\alpha, \beta)
\end{aligned} \tag{1}$$

Where:

$$\begin{aligned}
\log p(X|Z,\mu,\tau) &= \sum_{n=1}^{N}\sum_{k=1}^{K}\log p(X_n|Z_n=k,\mu_k,\tau) \\
\log p(S|Z,\lambda) &= \sum_{n=1}^{N}\sum_{k=1}^{K}\log p(S_n|Z_n=k,\lambda_k) \\
\log p(Z|\pi) &= \sum_{n=1}^{N}\log p(Z_n|\pi) \\
\log p(\mu|\nu,\rho) &= \sum_{k=1}^{K}\log p(\mu_k|\nu,\rho) \\
\log p(\lambda|\alpha,\beta) &= \sum_{k=1}^{K}\log p(\lambda_k|\alpha,\beta)
\end{aligned} \tag{2}$$

1.3 Question 1.3

Here, the mean field approximation is not an approximation but an equality because Z, μ, λ are independent. Therefore we have:

$$\begin{aligned}
\log q^*(Z_n) &\overset{\pm}{=} \mathbb{E}_{\mu,\lambda}[\log p(X_n, S_n, Z_n, \lambda, \mu|\pi,\tau,\alpha,\beta,\nu,\rho)] \\
&\overset{\pm}{=} \mathbb{E}_{\mu,\lambda}[\log p(X_n|Z_n,\mu,\tau) + \log p(S_n|Z_n,\lambda) + \log p(Z_n|\pi)] \\
&= \mathbb{E}_{\mu}\left[\sum_{k=1}^{K}\mathbb{1}_{\{Z_n=k\}}\left(\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\left((x_n-\mu_k)^T(x_n-\mu_k)\right)\right)\right] \\
&\qquad + \mathbb{E}_{\lambda}\left[\sum_{k=1}^{K}\mathbb{1}_{\{Z_n=k\}}\left(\log(\pi_k) - \lambda_k + S_n\log(\lambda_k) - \log(S_n!)\right)\right] \\
&\overset{\pm}{=} \sum_{k=1}^{K}\mathbb{1}_{\{Z_n=k\}}\left(\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\mathbb{E}_{\mu}\left[(x_n-\mu_k)^T(x_n-\mu_k)\right]\right. \\
&\qquad \left. + \log(\pi_k) + \mathbb{E}_{\lambda}\left[-\lambda_k + S_n\log(\lambda_k)\right] - \log(S_n!)\right)
\end{aligned} \tag{3}$$

Now, if we take the entire expression that is multiplied by $\mathbb{1}_{\{Z_n=k\}}$ and we call it $u_{n,k}$, we have:

$$q^*(Z_n) \propto \prod_{k=1}^{K} u_{n,k}^{\mathbb{1}_{\{Z_n=k\}}} \tag{4}$$

And if we normalize by taking $r_{n,k} = \frac{u_{n,k}}{\sum_{i=1}^{K} u_{n,i}}$ we get:

$$q^*(Z_n) = \prod_{k=1}^{K} r_{n,k}^{\mathbb{1}_{\{Z_n=k\}}} \tag{5}$$

Wich means that $q^*(Z_n)$ is a categorical distribution with parameters $r_{n,k}$. There for we have the expectation of Z_n easily because $\mathbb{E}[z_{n,k}] = r_{n,k}$ where $z_{n,k} = \mathbb{1}_{\{S_n=k\}}$. Note that $r_{n,k}$ depends of

the expected value of μ_k, μ_k^2, λ_k and $\log \lambda_k$. We will be able to compute these expected values by finding $q^*(\mu_k)$ and $q^*(\lambda_k)$.
Let us compute $q^*(\mu_k)$:

$$\begin{aligned}
\log q^*(\mu_k) &\overset{+}{=} \mathbb{E}_{Z,\lambda}[\log p(X, S, Z = k, \lambda_k, \mu_k | \pi, \tau, \alpha, \beta, \nu, \rho)] \\
&\overset{+}{=} \mathbb{E}_{Z,\lambda}[\log p(X | Z = k, \mu_k, \tau) + \log p(\mu_k | \nu, \rho)] \\
&= \mathbb{E}_{Z,\lambda}\left[\sum_{n=1}^{N} \mathbb{1}_{\{Z_n = k\}} \left(\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\left((x_n - \mu_k)^T (x_n - \mu_k)\right)\right)\right] \\
&\qquad + \log\left(\frac{\rho}{2\pi}\right) - \frac{\rho}{2}\left((\mu_k - \nu)^T (\mu_k - \nu)\right) \\
&\overset{+}{=} \sum_{n=1}^{N} r_{n,k} \left(\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\left((x_n - \mu_k)^T (x_n - \mu_k)\right)\right) - \frac{\rho}{2}\left((\mu_k - \nu)^T (\mu_k - \nu)\right) \\
&\overset{+}{=} \sum_{n=1}^{N} r_{n,k} \left(-\frac{\tau}{2}\left((x_n - \mu_k)^T (x_n - \mu_k)\right)\right) - \frac{\rho}{2}\left((\mu_k - \nu)^T (\mu_k - \nu)\right) \\
&\overset{+}{=} -\frac{\tau \sum_{n=1}^{N} r_{n,k}}{2}\left(-2\mu_{k,0} x_{n,0} - 2\mu_{k,1} x_{n,1} + \mu_{k,0}^2 + \mu_{k,1}^2\right) \\
&\qquad - \frac{\rho}{2}\left(-2\mu_{k,0}\nu_0 - 2\mu_{k,1}\nu_1 + \mu_{k,0}^2 + \mu_{k,1}^2\right)
\end{aligned} \tag{6}$$

We define $S = \frac{\rho}{\tau \sum_{n=1}^{N} r_{n,k}}$. Then we have:

$$\begin{aligned}
\log q^*(\mu_k) &\overset{+}{=} -\frac{\tau \sum_{n=1}^{N} r_{n,k}}{2}\Big[(S + N)\mu_{k,0}^2 + (S + N)\mu_{k,1}^2 \\
&\qquad -2\mu_{k,0}(S\nu_0 + \sum_{n=1}^{N} x_{n,0}) - 2\mu_{k,1}(S\nu_1 + \sum_{n=1}^{N} x_{n,1})\Big] \\
&\overset{+}{=} -\frac{\tau \sum_{n=1}^{N} r_{n,k}}{2(S + N)}\left[\left(\mu_k - \frac{S\nu + \sum_{n=1}^{N} x_n}{S + N}\right)^T \left(\mu_k - \frac{S\nu + \sum_{n=1}^{N} x_n}{S + N}\right)\right]
\end{aligned} \tag{7}$$

Therefore, we have $q^*(\mu_k) = Normal\left(\mu^*, \rho^* \cdot I\right)$. And we can compute the expected value of μ_k and μ_k^2 easily.

$$\begin{aligned}
\mu^* &= \frac{S\nu + \sum_{n=1}^{N} x_n}{S + N} = \frac{\rho\nu + \tau \sum_{n=1}^{N} r_{n,k} x_n}{\rho + N\tau \sum_{n=1}^{N} r_{n,k}} \\
\rho^* &= \frac{\tau \sum_{n=1}^{N} r_{n,k}}{S + N} = \frac{(\tau \sum_{n=1}^{N} r_{n,k})^2}{\rho + N\tau \sum_{n=1}^{N} r_{n,k}}
\end{aligned} \tag{8}$$

And therefore:

$$\begin{aligned}
\mathbb{E}[\mu_k] &= \mu^* \\
\mathbb{E}[\mu_k^2] &= \frac{1}{\rho^*} + \mu^{*T} \mu^*
\end{aligned} \tag{9}$$

Let us compute $q^*(\lambda_k)$:

$$\begin{aligned}
\log q^*(\lambda_k) &\overset{\pm}{=} \mathbb{E}_{Z,\mu}[\log p(X, S, Z = k, \lambda_k, \mu_k | \pi, \tau, \alpha, \beta, \nu, \rho)] \\
&\overset{\pm}{=} \mathbb{E}_{Z,\mu}[\log p(S|Z = k, \lambda_k) + \log p(\lambda_k|\alpha, \beta)] \\
&= \mathbb{E}_Z \left[\sum_{n=1}^{N} \mathbb{1}_{\{Z_n=k\}} \left(-\lambda_k + S_n \log(\lambda_k) - \log(S_n!)\right) \right] \\
&\qquad + \log\left(\frac{\beta^\alpha}{\Gamma(\alpha)}\right) + (\alpha - 1)\log(\lambda_k) - \beta\lambda_k \\
&\overset{\pm}{=} \sum_{n=1}^{N} r_{n,k} \left(-\lambda_k + S_n \log(\lambda_k)\right) + (\alpha - 1)\log(\lambda_k) - \beta\lambda_k \\
&= \left(\alpha + \sum_{n=1}^{N} S_n r_{n,k} - 1\right) \log(\lambda_k) - \left(\beta + \sum_{n=1}^{N} r_{n,k}\right) \lambda_k
\end{aligned} \tag{10}$$

Therefore, we have $q^*(\lambda_k) = Gamma\left(\alpha + \sum_{n=1}^{N} S_n r_{n,k}, \beta + \sum_{n=1}^{N} r_{n,k}\right)$. And we can compute the expected value of λ_k and $\log \lambda_k$ easily.

$$\begin{aligned}
\mathbb{E}[\lambda_k] &= \frac{\alpha + \sum_{n=1}^{N} S_n r_{n,k}}{\beta + \sum_{n=1}^{N} r_{n,k}} \\
\mathbb{E}[\log \lambda_k] &= \psi(\alpha + \sum_{n=1}^{N} S_n r_{n,k}) - \log(\beta + \sum_{n=1}^{N} r_{n,k})
\end{aligned} \tag{11}$$

A Appendix

A.1 Question 1.2

```
import matplotlib.pyplot as plt
import numpy as np
from scipy.stats import gamma, norm
from scipy.special import psi
np.random.seed(14)

def generate_data(mu, tau, N):
    # Insert your code here
    D = np.random.normal(mu, np.sqrt(1/tau), N)

    return D

MU = 1
TAU = 0.5

dataset_1 = generate_data(MU, TAU, 10)
dataset_2 = generate_data(MU, TAU, 100)
dataset_3 = generate_data(MU, TAU, 1000)

# Visulaize the datasets via histograms
# Insert your code here
fig, axs = plt.subplots(1, 3, figsize=(12, 4))
axs[0].hist(dataset_1, bins=20)
axs[1].hist(dataset_2, bins=20)
axs[2].hist(dataset_3, bins=20)
plt.tight_layout()
plt.savefig('12_data.png')
plt.show()
```
