# 1   Exponential Family

## Question 1.1

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= h(x)\exp(\eta(\lambda) \cdot T(x) - A(\eta(\lambda))) \\
&= h(x)\exp(\log \lambda \cdot x - A(\log \lambda)) \\
&= h(x)\exp(\log \lambda \cdot x - \lambda) \\
&= h(x)\exp(\log \lambda \cdot x)\exp(-\lambda) \\
&= e^{-\lambda}\frac{\lambda^x}{x!}
\end{aligned}
\tag{1}
$$

We can see that the distribution correspond to a <u>Poisson distribution of parameter $\lambda$</u>.

## Question 1.2

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= \exp(\eta([\alpha, \beta]) \cdot [\log x, x] - A(\alpha - 1, -\beta)) \\
&= \exp([\alpha - 1, -\beta] \cdot [\log x, x] - \log \Gamma(\alpha) + \alpha \log(\beta)) \\
&= \exp((\alpha - 1)\log x - \beta x - \log \Gamma(\alpha) + \alpha \log(\beta)) \\
&= \frac{\beta^\alpha}{\Gamma(\alpha)}x^{\alpha-1}e^{-\beta x}
\end{aligned}
\tag{2}
$$

We can see that the distribution correspond to a <u>Gamma distribution of parameters $\alpha$ and $\beta$</u>.

## Question 1.3

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= \frac{\exp(\eta([\mu, \sigma^2]) \cdot [x, x^2] - A(\eta([\mu, \sigma^2])))}{\sqrt{2\pi}} \\
&= \frac{\exp([\frac{\mu}{\sigma^2}, -\frac{1}{2\sigma^2}] \cdot [x, x^2] - A([\frac{\mu}{\sigma^2}, -\frac{1}{2\sigma^2}]))}{\sqrt{2\pi}} \\
&= \frac{\exp(\frac{\mu x}{\sigma^2} - \frac{x^2}{2\sigma^2} - \frac{\mu^2}{2\sigma^2} - \log \sigma)}{\sqrt{2\pi}} \\
&= \frac{\exp(-\frac{(x-\mu)^2}{2\sigma^2})}{\sigma\sqrt{2\pi}}
\end{aligned}
\tag{3}
$$

We can see that the distribution correspond to a <u>Normal distribution of parameters $\mu$ and $\sigma^2$</u>.

## Question 1.4

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= 2\exp(\eta(\lambda) \cdot x - A(\eta(\lambda))) \\
&= 2\exp(-\lambda x - A(-\lambda)) \\
&= 2\exp\left(-\lambda x + \log\left(\frac{\lambda}{2}\right)\right) \\
&= \lambda e^{-\lambda x}
\end{aligned}
\tag{4}
$$

We can see that the distribution correspond to a <u>Exponential distribution of parameter $\lambda$</u>.

## Question 1.5

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= \exp(\eta([\psi_1, \psi_2]) \cdot [\log x, \log(1-x)] - A(\eta([\psi_1, \psi_2]))) \\
&= \exp([\psi_1 - 1, \psi_2 - 1] \cdot [\log x, \log(1-x)] - A([\psi_1 - 1, \psi_2 - 1])) \\
&= \exp((\psi_1 - 1)\log x + (\psi_2 - 1)\log(1-x) - \log\Gamma(\psi_1) - \log\Gamma(\psi_2) + \log\Gamma(\psi_1 + \psi_2)) \\
&= \frac{\Gamma(\psi_1 + \psi_2)}{\Gamma(\psi_1)\Gamma(\psi_2)} x^{\psi_1 - 1}(1-x)^{\psi_2 - 1}
\end{aligned}
\tag{5}
$$

We can see that the distribution correspond to a <u>Beta distribution of parameters $\psi_1$ and $\psi_2$</u>.
# 2 Dependencies in a Directed Graphical Model

Figure 1: Graphical model of smooth LDA.

## Question 2.6

The Bayes net take this form :

Then, if we use the method using the d-separation, we obtain this :

Therefore, we can see that $W_{d,n} \perp W_{d,n+1} | \theta_d, \beta_{1:K}$ is <u>false</u>.

Figure 3: DGM

## Question 3.12

In the bishop book, we can see that :

$$p(X|\mu, \tau) = \left(\frac{\tau}{2\pi}\right)^{N/2} \exp\left\{-\frac{\tau}{2}\sum_{n=1}^{N}(x_n - \mu)^2\right\} \tag{6}$$

$$p(\mu|\tau) = \mathcal{N}(\mu|\mu_0, (\lambda_0\tau)^{-1}) \tag{7}$$

$$p(\tau) = \mathrm{Gam}(\tau|a_0, b_0) \tag{8}$$

Then, by using the code in appendix 3, we obtain :

Figure 4: Generated Data.

## Question 3.13

Let's find the ML estimates of $\mu$ and $\tau$. We know that $\log(q^*(\mu)) = \mathbb{E}_{-\mu}[\log p(X, \mu, \tau)]$. Then, we can write :

$$
\begin{aligned}
\log(q^*(\mu)) &= \mathbb{E}_{-\mu}[\log p(X, \mu, \tau)] \\
&\overset{+}{=} \mathbb{E}_\tau[\log p(X|\mu, \tau) + \log p(\mu|\tau)] \\
&= \mathbb{E}_\tau \left[ \frac{N}{2} \log\left(\frac{\tau}{2\pi}\right) + \frac{\tau}{2} \sum_{n=1}^{N} (x_n - \mu)^2 + \frac{1}{2} \log\left(\frac{\lambda_0 \tau}{2\pi}\right) + \frac{\lambda_0 \tau}{2} (\mu - \mu_0) \right] \\
&\overset{+}{=} \frac{\mathbb{E}_\tau[\tau]}{2} \left( \lambda_0(\mu - \mu_0) + \sum_{n=1}^{N} (x_n - \mu)^2 \right) \\
&= -\frac{\mathbb{E}_\tau[\tau]}{2} \left( \lambda_0 \mu^2 - 2\lambda_0 \mu \mu_0 + \lambda_0 \mu_0^2 + \sum_{n=1}^{N} x_n^2 - 2\mu \sum_{n=1}^{N} x_n + N\mu^2 \right) \\
&= -\frac{\mathbb{E}_\tau[\tau]}{2} \left( (\lambda_0 + N)\mu^2 - 2(\lambda_0 \mu_0 + \sum_{n=1}^{N} x_n)\mu + \lambda_0 \mu_0^2 + \sum_{n=1}^{N} x_n^2 \right) \\
&= -\frac{\mathbb{E}_\tau[\tau](\lambda_0 + N)}{2} \left( \mu^2 - 2\mu \cdot \frac{\lambda_0 \mu_0 + \sum_{n=1}^{N} x_n}{\lambda_0 + N} + \frac{\lambda_0 \mu_0^2 + \sum_{n=1}^{N} x_n^2}{\lambda_0 + N} \right)
\end{aligned}
\tag{9}
$$

Therefore we can conclude that $q^*(\mu) = \mathcal{N}(\mu|\mu', \lambda'^{-1})$ with :

$$
\mu' = \frac{\lambda_0 \mu_0 + \sum_{n=1}^{N} x_n}{\lambda_0 + N}
\tag{10}
$$

$$
\lambda' = (\lambda_0 + N)\mathbb{E}[\tau]
\tag{11}
$$

And for $\tau$ we have :

$$
\begin{aligned}
\log(q^*(\tau)) &= \mathbb{E}_{-\tau}[\log p(X, \mu, \tau)] \\
&\overset{+}{=} \mathbb{E}_{\mu}[\log p(X|\mu, \tau) + \log p(\mu|\tau)] + \log p(\tau) \\
&\overset{+}{=} (a_0 - 1)\log \tau - b_0 \tau + \frac{N}{2}\log \tau - \frac{\tau}{2}\mathbb{E}_{\mu}\left[\sum_{n=1}^{N}(x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right] \\
&= \left(a_0 + \frac{N}{2} - 1\right)\log \tau - \left(b_0 + \frac{1}{2}\mathbb{E}_{\mu}\left[\sum_{n=1}^{N}(x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right]\right)\tau
\end{aligned}
\tag{12}
$$

Therefore we can conclude that $q^*(\tau) = \text{Gam}(\tau|a', b')$ with :

$$
a' = a_0 + \frac{N}{2}
\tag{13}
$$

$$
b' = b_0 + \frac{1}{2}\mathbb{E}_{\mu}\left[\sum_{n=1}^{N}(x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right]
\tag{14}
$$

# Appendix

## Python Code

```python
from typing import List
import numpy as np
import scipy.special as sp_spec
import numpy.random as np_rand
import matplotlib.pyplot as plt
from sklearn.cluster import KMeans
from sklearn.metrics import adjusted_rand_score
import seaborn as sns

def generate_data(N: int, mu: float, tau: float) -> np.ndarray:
    return np_rand.normal(mu, tau, N)

def plot_data(X: np.ndarray, ax: plt.Axes) -> None:
    ax.hist(X, bins=20, density=True)
    ax.set_xlabel('x')
    ax.set_ylabel('p(x)')
    ax.set_title(f'N = {len(X)}')

MU = 1
TAU = 0.5
N = [10, 100, 1000]
Xs = [generate_data(n, MU, TAU) for n in N]

fig, axs = plt.subplots(1, 3, figsize=(12, 4))
for i in range(len(Xs)):
    plot_data(Xs[i], axs[i])
plt.tight_layout()
plt.savefig('12_data.png')
```
