1 Exponential Family

1.1 Question 1.1

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= h(x)\exp(\eta(\lambda) \cdot T(x) - A(\eta(\lambda))) \\
&= h(x)\exp(\log\lambda \cdot x - A(\log\lambda)) \\
&= h(x)\exp(\log\lambda \cdot x - \lambda) \\
&= h(x)\exp(\log\lambda \cdot x)\exp(-\lambda) \\
&= e^{-\lambda}\frac{\lambda^x}{x!}
\end{aligned}
\tag{1}
$$

We can see that the distribution correspond to a $\underline{\text{Poisson distribution of parameter } \lambda}$.

1.2 Question 1.2

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= \exp(\eta([\alpha,\beta]) \cdot [\log x, x] - A(\alpha - 1, -\beta)) \\
&= \exp([\alpha - 1, -\beta] \cdot [\log x, x] - \log\Gamma(\alpha) + \alpha\log(\beta)) \\
&= \exp((\alpha - 1)\log x - \beta x - \log\Gamma(\alpha) + \alpha\log(\beta)) \\
&= \frac{\beta^\alpha}{\Gamma(\alpha)}x^{\alpha-1}e^{-\beta x}
\end{aligned}
\tag{2}
$$

We can see that the distribution correspond to a $\underline{\text{Gamma distribution of parameters } \alpha \text{ and } \beta}$.

1.3 Question 1.3

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= \frac{\exp(\eta([\mu,\sigma^2]) \cdot [x, x^2] - A(\eta([\mu,\sigma^2])))}{\sqrt{2\pi}} \\
&= \frac{\exp([\frac{\mu}{\sigma^2}, -\frac{1}{2\sigma^2}] \cdot [x, x^2] - A([\frac{\mu}{\sigma^2}, -\frac{1}{2\sigma^2}]))}{\sqrt{2\pi}} \\
&= \frac{\exp(\frac{\mu x}{\sigma^2} - \frac{x^2}{2\sigma^2} - \frac{\mu^2}{2\sigma^2} - \log\sigma)}{\sqrt{2\pi}} \\
&= \frac{\exp(-\frac{(x-\mu)^2}{2\sigma^2})}{\sigma\sqrt{2\pi}}
\end{aligned}
\tag{3}
$$

We can see that the distribution correspond to a $\underline{\text{Normal distribution of parameters } \mu \text{ and } \sigma^2}$.

1.4 Question 1.4

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta) \cdot T(x) - A(\eta)) \\
&= 2\exp(\eta(\lambda) \cdot x - A(\eta(\lambda))) \\
&= 2\exp(-\lambda x - A(-\lambda)) \\
&= 2\exp\left(-\lambda x + \log\left(\frac{\lambda}{2}\right)\right) \\
&= \lambda e^{-\lambda x}
\end{aligned}
\tag{4}
$$

We can see that the distribution correspond to a $\underline{\text{Exponential distribution of parameter } \lambda}$.

1.5   Question 1.5

$$
\begin{aligned}
p(x|\theta) &= h(x)\exp(\eta(\theta)\cdot T(x) - A(\eta)) \\
&= \exp(\eta([\psi_1, \psi_2])\cdot [\log x, \log(1-x)] - A(\eta([\psi_1, \psi_2]))) \\
&= \exp([\psi_1 - 1, \psi_2 - 1]\cdot [\log x, \log(1-x)] - A([\psi_1 - 1, \psi_2 - 1])) \\
&= \exp((\psi_1 - 1)\log x + (\psi_2 - 1)\log(1-x) - \log\Gamma(\psi_1) - \log\Gamma(\psi_2) + \log\Gamma(\psi_1 + \psi_2)) \\
&= \frac{\Gamma(\psi_1 + \psi_2)}{\Gamma(\psi_1)\Gamma(\psi_2)}x^{\psi_1 - 1}(1-x)^{\psi_2 - 1}
\end{aligned}
\tag{5}
$$

We can see that the distribution correspond to a Beta distribution of parameters ψ_1 and ψ_2.

2   Dependencies in a Directed Graphical Model
2.1   Question 2.6

Figure 1: Graphical model of smooth LDA.

The Bayes net take this form :
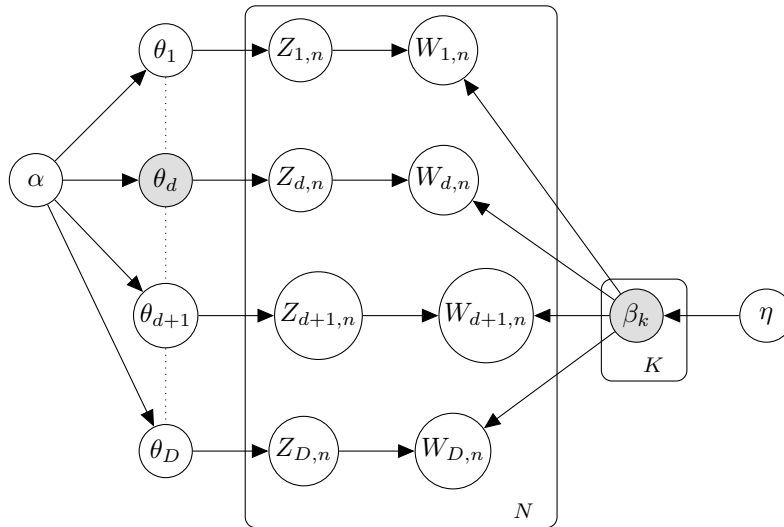

Then, if we use the method using the d-separation, we obtain this :
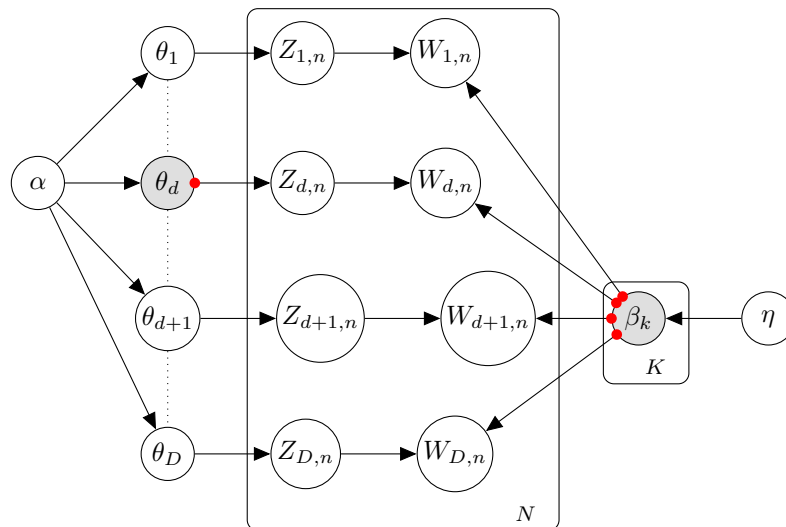

Therefore, we can see that $W_{d,n} \perp W_{d,n+1}|\theta_d, \beta_{1:K}$ is <u>true</u>.

2.2 Question 2.7

The Bayes net take this form (with d-separation marks) :

Therefore, we can see that $\theta_d \perp \theta_{d+1}|Z_{d,1:N}$ is <u>false</u>.

2.3 Question 2.8

The Bayes net take this form (with d-separation marks) :

Therefore, we can see that $\theta_d \perp \theta_{d+1} | \alpha, Z_{1:D,1:N}$ is <u>true</u>.

2.4 Question 2.9
Figure 2: Graphical model of Labeled LDA.

The Bayes net take this form (with d-separation marks) :
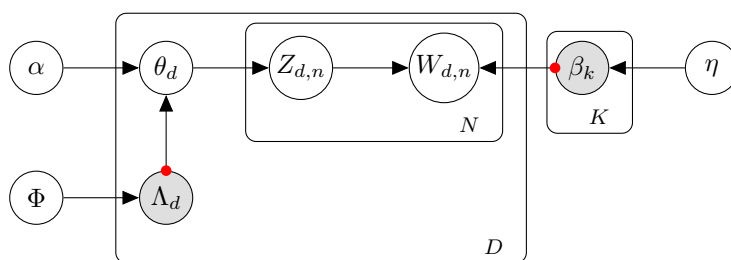

Therefore, we can see that $W_{d,n} \perp W_{d,n+1} | \Lambda_d, \beta_{1:K}$ is <u>false</u>.
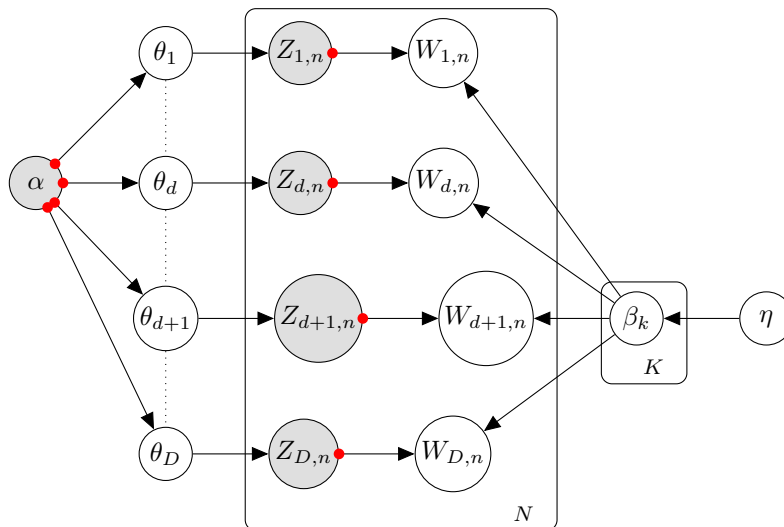

2.5 Question 2.10

The Bayes net take this form (with d-separation marks) :
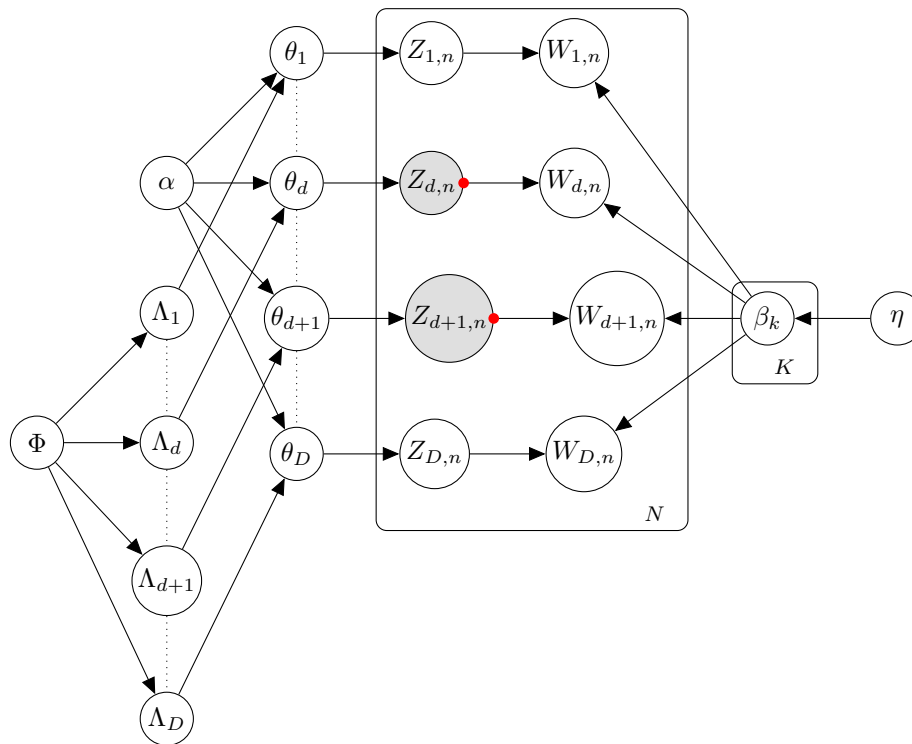

Therefore, we can see that $\theta_d \perp \theta_{d+1} | Z_{d,1:N}, Z_{d+1,1:N}$ is <u>false</u>.

2.6 Question 2.11

The Bayes net take this form (with d-separation marks) :
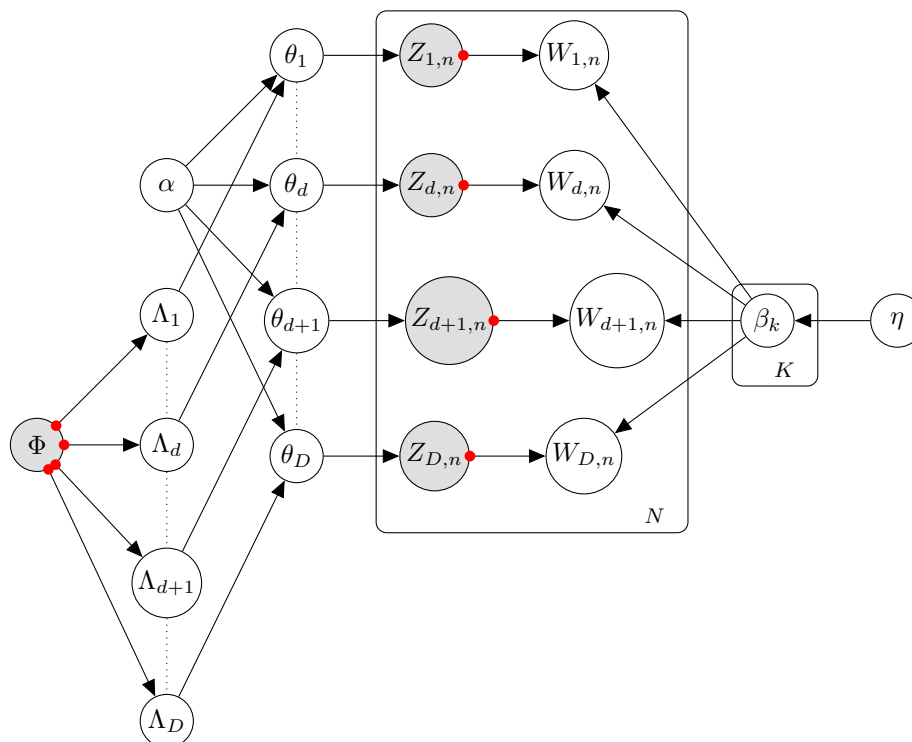

Therefore, we can see that $\Lambda_d \perp \Lambda_{d+1}|\Phi, Z_{1:D,1:N}$ is <u>false</u>.

3 CAVI
Figure 3: DGM

3.1 Question 3.12

In the bishop book, we can see that :

$$p(X|\mu,\tau) = \left(\frac{\tau}{2\pi}\right)^{N/2} \exp\left\{-\frac{\tau}{2}\sum_{n=1}^{N}(x_n - \mu)^2\right\} \tag{6}$$

$$p(\mu|\tau) = \mathcal{N}(\mu|\mu_0, (\lambda_0\tau)^{-1}) \tag{7}$$

$$p(\tau) = \text{Gam}(\tau|a_0, b_0) \tag{8}$$

Then, by using the code in appendix A.1, we obtain :

Figure 4: Generated Data

3.2 Question 3.13

Let's find the ML estimates of μ and τ. We know that $\log(q^*(\mu)) = \mathbb{E}_{-\mu}[\log p(X, \mu, \tau)]$. Then, we can write :

$$
\begin{aligned}
\log(q^*(\mu)) &= \mathbb{E}_{-\mu}[\log p(X, \mu, \tau)] \\
&\stackrel{+}{=} \mathbb{E}_\tau[\log p(X|\mu, \tau) + \log p(\mu|\tau)] \\
&= \mathbb{E}_\tau\left[\frac{N}{2}\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\sum_{n=1}^N (x_n - \mu)^2 + \frac{1}{2}\log\left(\frac{\lambda_0 \tau}{2\pi}\right) - \frac{\lambda_0 \tau}{2}(\mu - \mu_0)^2\right] \\
&\stackrel{+}{=} -\frac{\mathbb{E}_\tau[\tau]}{2}\left(\lambda_0(\mu - \mu_0)^2 + \sum_{n=1}^N (x_n - \mu)^2\right) \\
&= -\frac{\mathbb{E}_\tau[\tau]}{2}\left(\lambda_0\mu^2 - 2\lambda_0\mu\mu_0 + \lambda_0\mu_0^2 + \sum_{n=1}^N x_n^2 - 2\mu\sum_{n=1}^N x_n + N\mu^2\right) \\
&= -\frac{\mathbb{E}_\tau[\tau]}{2}\left((\lambda_0 + N)\mu^2 - 2(\lambda_0\mu_0 + \sum_{n=1}^N x_n)\mu + \lambda_0\mu_0^2 + \sum_{n=1}^N x_n^2\right) \\
&\stackrel{+}{=} -\frac{\mathbb{E}_\tau[\tau](\lambda_0 + N)}{2}\left(\mu^2 - 2\mu\frac{\lambda_0\mu_0 + \sum_{n=1}^N x_n}{\lambda_0 + N}\right)
\end{aligned}
\tag{9}
$$

Therefore we can conclude that $q^*(\mu) = \mathcal{N}(\mu|\mu_N, \lambda_N^{-1})$ with :

$$
\mu_N = \frac{\lambda_0\mu_0 + \sum_{n=1}^N x_n}{\lambda_0 + N}
\tag{10}
$$

$$
\lambda_N = (\lambda_0 + N)\mathbb{E}[\tau]
\tag{11}
$$

And for τ we have :

$$
\begin{aligned}
\log(q^*(\tau)) &= \mathbb{E}_{-\tau}[\log p(X, \mu, \tau)] \\
&\stackrel{+}{=} \mathbb{E}_\mu[\log p(X|\mu, \tau) + \log p(\mu|\tau)] + \log p(\tau) \\
&\stackrel{+}{=} (a_0 - 1)\log\tau - b_0\tau + \frac{N+1}{2}\log\tau - \frac{\tau}{2}\mathbb{E}_\mu\left[\sum_{n=1}^N (x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right] \\
&= (a_0 + \frac{N+1}{2} - 1)\log\tau - \left(b_0 + \frac{1}{2}\mathbb{E}_\mu\left[\sum_{n=1}^N (x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right]\right)\tau
\end{aligned}
\tag{12}
$$

Therefore we can conclude that $q^*(\tau) = \text{Gam}(\tau|a_N, b_N)$ with :

$$
a_N = a_0 + \frac{N+1}{2}
\tag{13}
$$

$$
\begin{aligned}
b_N &= b_0 + \frac{1}{2}\mathbb{E}_\mu\left[\sum_{n=1}^N (x_n - \mu)^2 + \lambda_0(\mu - \mu_0)^2\right] \\
b_N &= b_0 + \frac{1}{2}\left(\sum_{n=1}^N x_n^2 + N\mathbb{E}_\mu[\mu^2] - 2\mathbb{E}_\mu[\mu]\sum_{n=1}^N x_n + \lambda_0\left(\mathbb{E}_\mu[\mu^2] + \mu_0^2 - 2\mu_0\mathbb{E}_\mu[\mu]\right)\right)
\end{aligned}
\tag{14}
$$

With :

$$
\begin{aligned}
\mathbb{E}_{q(\mu)}[\mu] &= \mu_N \\
\mathbb{E}_{q(\mu)}[\mu^2] &= \frac{1}{\lambda_N} + \mu_N^2 \\
\mathbb{E}_{q(\tau)}[\tau] &= \frac{a_N}{b_N}
\end{aligned}
\tag{15}
$$

If we take non-informative priors then $a_0 = b_0 = \mu_0 = \lambda_0 = 0$, then we have :

$$
\begin{aligned}
\mu_N &= \overline{x} \\
\lambda_N &= N\mathbb{E}[\tau] \\
a_N &= \frac{N+1}{2} \\
b_N &= \frac{1}{2}\mathbb{E}_\mu\left[\sum_{n=1}^N (x_n - \mu)^2\right]
\end{aligned}
\tag{16}
$$

And by using $\mathbb{E}[\tau] = \frac{a_N}{b_N}$ we obtain :

$$
\begin{aligned}
\frac{1}{\mathbb{E}[\tau]} &= \frac{b_N}{a_N} \\
\frac{1}{\mathbb{E}[\tau]} &= \frac{2}{2(N+1)}\mathbb{E}_\mu\left[\sum_{n=1}^N (x_n - \mu)^2\right] \\
\frac{1}{\mathbb{E}[\tau]} &= \frac{N}{N+1}\left(\overline{x^2} - 2\overline{x}\mathbb{E}[\mu] + \mathbb{E}[\mu^2]\right)
\end{aligned}
\tag{17}
$$

And, with the fact that $\mathbb{E}[\mu] = \mu_N$ and $\mathbb{E}[\mu^2] = \frac{1}{\lambda_N} + \mu_N^2$, we obtain :

$$
\begin{aligned}
\mathbb{E}[\mu] &= \overline{x} \\
\mathbb{E}[\mu^2] &= \frac{1}{N\mathbb{E}[\tau]} + \overline{x}^2
\end{aligned}
\tag{18}
$$

And therefore:

$$
\begin{aligned}
\frac{1}{\mathbb{E}[\tau]} = \frac{N}{N+1}\left(\overline{x^2} - 2\overline{x}^2 + \frac{1}{N\mathbb{E}[\tau]} + \overline{x}^2\right) &\Leftrightarrow \frac{1}{\mathbb{E}[\tau]} - \frac{1}{(N+1)\mathbb{E}[\tau]} = \frac{N}{N+1}\left(\overline{x^2} - \overline{x}^2\right) \\
&\Leftrightarrow \frac{N+1-1}{(N+1)\mathbb{E}[\tau]} = \frac{N}{N+1}\left(\overline{x^2} - \overline{x}^2\right) \\
&\Leftrightarrow \frac{1}{\mathbb{E}[\tau]} = \left(\overline{x^2} - \overline{x}^2\right) \\
&\Leftrightarrow \frac{1}{\mathbb{E}[\tau]} = \frac{1}{N}\sum_{n=1}^N (x_n - \overline{x})^2
\end{aligned}
\tag{19}
$$

Which define the ML estimates. The implementation is in the code in appendix A.1.

3.3   Question 3.14

The posterior is defined as $p(\mu, \tau | x)$. Then, we can write :

$$
\begin{aligned}
p(\mu, \tau | x) &= \frac{p(x|\mu, \tau)p(\mu, \tau)}{p(x)} \\
&\propto p(x|\mu, \tau)p(\mu, \tau)
\end{aligned}
\tag{20}
$$

Where $x|\mu, \tau \sim \mathcal{N}(\mu|\mu, \tau^{-1})$ and $\mu, \tau \sim NormalGamma(\mu_0, \lambda_0, a_0, b_0)$. Therefore, as we saw in the question 1.3 in the Module 1 exercise, we have $\mu, \tau | x \sim NormalGamma(\mu', \lambda', a', b')$, where :

$$
\begin{aligned}
\mu' &= \frac{N\overline{x} + \mu_0\lambda_0}{N + \lambda_0} \\
\lambda' &= N + \lambda_0 \\
a' &= a_0 + \frac{N-1}{2} \\
b' &= b_0 + \frac{1}{2}\left(\sum_{n=1}^N x_n^2 + \lambda_0\mu_0^2 - \frac{(N\overline{x} + \mu_0\lambda_0)^2}{N + \lambda_0}\right)
\end{aligned}
\tag{21}
$$

Therefore, if we plot the contour for each datasets we obtain :
Figure 5: Contours of exact posteriors by datasets

The rest of the answer is in the code in appendix A.1.

3.4   Question 3.15

The equation (10.24) in the Bishop is the mean-field approximation which is :

$$q(\mu, \tau) = q(\mu)q(\tau) \tag{22}$$

This time, we take the result of the question 3.13 without setting the priors to 0. Then, we have :

$$\begin{aligned}
q(\mu) &= \mathcal{N}(\mu|\mu_N, \lambda_N^{-1}) \\
q(\tau) &= \mathrm{Gam}(\tau|a_N, b_N)
\end{aligned} \tag{23}$$

with updates equations in the cavi algorithm described by :

$$\begin{aligned}
\mu_N &= \frac{\lambda_0 \mu_0 + N\overline{x}}{\lambda_0 + N} \\
\lambda_N &= (\lambda_0 + N)\mathbb{E}[\tau] \\
a_N &= a_0 + \frac{N+1}{2} \\
b_N &= b_0 + \frac{1}{2}\left(\sum_{n=1}^{N} x_n^2 + N\mathbb{E}_\mu[\mu^2] - 2\mathbb{E}_\mu[\mu]\sum_{n=1}^{N} x_n + \lambda_0\left(\mathbb{E}_\mu[\mu^2] + \mu_0^2 - 2\mu_0\mathbb{E}_\mu[\mu]\right)\right)
\end{aligned} \tag{24}$$

and the expectations are the ones described in the equation (15).
Now, we need to find the ELBO formula :

$$\begin{aligned}
\mathcal{L}(q) &= \mathbb{E}_{q(\mu),q(\tau)}[\log p(X, \mu, \tau)] - \mathbb{E}_{q(\mu),q(\tau)}[\log q(\mu, \tau)] \\
&= \mathbb{E}_{q(\mu),q(\tau)}[\log p(X|\mu, \tau) + \log p(\mu, \tau)] - \mathbb{E}_{q(\mu),q(\tau)}[\log q(\mu) + \log q(\tau)] \\
&= \mathbb{E}_{q(\mu),q(\tau)}[\log p(X|\mu, \tau)] + \mathbb{E}_{q(\mu),q(\tau)}[\log p(\mu, \tau)] - \mathbb{E}_{q(\mu)}[\log q(\mu)] - \mathbb{E}_{q(\tau)}[\log q(\tau)] \\
&= \mathbb{E}_{q(\mu),q(\tau)}[\log p(X|\mu, \tau)] + \mathbb{E}_{q(\mu),q(\tau)}[\log p(\mu, \tau)] + \mathbb{H}_q[\mu] + \mathbb{H}_q[\tau]
\end{aligned} \tag{25}$$

If we compute the first term we have:

$$
\begin{aligned}
\mathbb{E}_{q(\mu),q(\tau)}[\log p(X|\mu,\tau)] &= \mathbb{E}_{q(\mu),q(\tau)}\left[\frac{N}{2}\log\left(\frac{\tau}{2\pi}\right) - \frac{\tau}{2}\sum_{n=1}^{N}(x_n-\mu)^2\right] \\
&= \frac{N}{2}\left(\mathbb{E}_{q(\tau)}[\log\tau] - \log(2\pi)\right) \\
&\quad - \frac{\mathbb{E}_{q(\tau)}[\tau]}{2}\left(\sum_{n=1}^{N}x_n^2 - 2\mathbb{E}_{q(\mu)}[\mu]N\overline{x_n} + N\mathbb{E}_{q(\mu)}[\mu^2]\right) \\
&\overset{\pm}{=} \frac{N}{2}\mathbb{E}_{q(\tau)}[\log\tau] - \frac{\mathbb{E}_{q(\tau)}[\tau]}{2}\left(\sum_{n=1}^{N}x_n^2 - 2\mathbb{E}_{q(\mu)}[\mu]N\overline{x_n} + N\mathbb{E}_{q(\mu)}[\mu^2]\right)
\end{aligned}
\tag{26}
$$

And the second one is:

$$
\begin{aligned}
\mathbb{E}_{q(\mu),q(\tau)}[\log p(\mu,\tau)] &= \mathbb{E}_{q(\mu),q(\tau)}\left[\log\left(\frac{b_0^{a_0}\sqrt{\lambda_0}}{\Gamma(a_0)\sqrt{2\pi}}\right) + (a_0 - \frac{1}{2})\log\tau - b_0\tau - \frac{\lambda_0\tau(\mu-\mu_0)^2}{2}\right] \\
&= \log\left(\frac{b_0^{a_0}\sqrt{\lambda_0}}{\Gamma(a_0)\sqrt{2\pi}}\right) + (a_0 - \frac{1}{2})\mathbb{E}_{q(\tau)}[\log\tau] - b_0\mathbb{E}_{q(\tau)}[\tau] - \frac{\lambda_0\mathbb{E}_{q(\tau)}[\tau]}{2}\left(\mathbb{E}_{q(\mu)}[\mu^2] - 2\mu_0\mathbb{E}_{q(\mu)}[\mu] + \mu_0^2\right) \\
&\overset{\pm}{=} (a_0 - \frac{1}{2})\mathbb{E}_{q(\tau)}[\log\tau] - b_0\mathbb{E}_{q(\tau)}[\tau] - \frac{\lambda_0\mathbb{E}_{q(\tau)}[\tau]}{2}\left(\mathbb{E}_{q(\mu)}[\mu^2] - 2\mu_0\mathbb{E}_{q(\mu)}[\mu] + \mu_0^2\right)
\end{aligned}
\tag{27}
$$

And we can compute all of that because entropies are known and we have the following expectations:

$$
\begin{aligned}
\mathbb{E}_{q(\mu)}[\mu] &= \mu_N \\
\mathbb{E}_{q(\mu)}[\mu^2] &= \frac{1}{\lambda_N} + \mu_N^2 \\
\mathbb{E}_{q(\tau)}[\tau] &= \frac{a_N}{b_N} \\
\mathbb{E}_{q(\tau)}[\log\tau] &= \psi(a_N) - \log b_N
\end{aligned}
\tag{28}
$$

Then we obtain this result :
Figure 6: Contours of the approximations by VI and the exact posterior by datasets, by iterations

And we obtain an elbo plot :
Figure 7: ELBO plot by datasets

The code is in appendix A.1.

4   SVI - LDA

4.1   Question 4.16

According to the Hoffman paper, the local hidden variables are defined by the model where the distribution of each observation x_n only depends on its corresponding local variable z_n and the global variables $\beta_{1:K}$. Therefore, we can write:

$$p(x, z, \beta | alpha) = p(\beta | \alpha) \prod_{n=1}^{N} p(x_n, z_n | \beta) \tag{29}$$

Because:

$$p(x_n, z_n | x_{-n}, z_{-n}, \beta, \alpha) = p(x_n, z_n | \beta, \alpha) \tag{30}$$

4.2   Question 4.17

In this figure the global hidden variables are the topics $\beta_{1:K}$ and the local hidden variables are the topic proportions θ_d and the topic assignments $z_{d,1:N}$.

4.3   Question 4.18

The ELBO formula is:

$$\mathcal{L}(q) = \mathbb{E}_{q(\theta,z,\beta)}[\log p(w, \theta, z, \beta)] - \mathbb{E}_{q(\theta,z,\beta)}[\log q(\theta, z, \beta)] \tag{31}$$

And here we recall that we have:

$$p(w, z, \theta, \beta) = \prod_{k=1}^{K} p(\beta_k) \prod_{d=1}^{D} p(\theta_d) \prod_{d=1}^{D} \prod_{n=1}^{N} p(z_{dn} | \theta_d) p(w_{dn} | \beta_{z_{dn}}) \tag{32}$$

Therefore we have:

$$
\begin{aligned}
&\mathbb{E}_{q(\theta,z,\beta)}[\log p(w,\theta,z,\beta)] \\
&= \mathbb{E}_{q(\theta,z,\beta)}\left[\sum_{k=1}^{K}\log p(\beta_k) + \sum_{d=1}^{D}\log p(\theta_d) + \sum_{d=1}^{D}\sum_{n=1}^{N}\log p(z_{dn}|\theta_d)p(w_{dn}|\beta_{z_{dn}})\right] \\
&\quad - \mathbb{E}_{q(\theta,z,\beta)}\left[\sum_{k=1}^{K}\log q(\beta_k) + \sum_{d=1}^{D}\log q(\theta_d) + \sum_{d=1}^{D}\sum_{n=1}^{N}\log q(z_{dn}|\theta_d) + \log q(w_{dn}|\beta_{z_{dn}})\right] \\
&= \sum_{k=1}^{K}\mathbb{E}_{q(\beta_k)}[\log p(\beta_k)] + \sum_{d=1}^{D}\mathbb{E}_{q(\theta_d)}[\log p(\theta_d)] + \sum_{d=1}^{D}\sum_{n=1}^{N}\mathbb{E}_{q(z_{dn}),q(\theta_d)}[\log p(z_{dn}|\theta_d)] \\
&\quad + \sum_{d=1}^{D}\sum_{n=1}^{N}\mathbb{E}_{q(z_{dn}),q(\beta_{z_{dn}})}[\log p(w_{dn}|\beta_{z_{dn}})] \\
&\quad + \sum_{k=1}^{K}\mathbb{H}_q[\beta_k] + \sum_{d=1}^{D}\mathbb{H}_q[\theta_d] + \sum_{d=1}^{D}\sum_{n=1}^{N}\mathbb{H}_q[z_{dn}|\theta_d] + \mathbb{H}_q[w_{dn}|\beta_{z_{dn}}]
\end{aligned}
\tag{33}
$$

Using Hoffman updates equations, we can write:

$$
\begin{aligned}
\lambda_k &= \eta + \sum_{d=1}^{D}\sum_{n=1}^{N}z_{dn}^k w_{dn} \\
\gamma_d &= \alpha + \sum_{n=1}^{N}z_{dn} \\
\phi_{dn} &= \log\beta_{k,w_{dn}} + \log\theta_{dk}
\end{aligned}
\tag{34}
$$

And by using the expectations given in the Hoffman paper, we can write:

$$
\begin{aligned}
\sum_{k=1}^{K}\mathbb{E}_{q(\beta_k)}[\log p(\beta_k)] &= \sum_{k=1}^{K}\sum_{\nu=1}^{W}(\eta-1)\mathbb{E}_{q(\beta_{k\nu})}[\log\beta_{k\nu}] \\
&= \sum_{k=1}^{K}\sum_{\nu=1}^{W}(\eta-1)\left(\Psi(\lambda_{k\nu}) - \Psi\left(\sum_{y=1}^{W}\lambda_{ky}\right)\right)
\end{aligned}
\tag{35}
$$

$$
\begin{aligned}
\sum_{d=1}^{D}\mathbb{E}_{q(\theta_d)}[\log p(\theta_d)] &= \sum_{d=1}^{D}\sum_{k=1}^{K}(\alpha-1)\mathbb{E}_{q(\theta_{dk})}[\log\theta_{dk}] \\
&= \sum_{d=1}^{D}\sum_{k=1}^{K}(\alpha-1)\left(\Psi(\gamma_{dk}) - \Psi\left(\sum_{v=1}^{K}\gamma_{dv}\right)\right)
\end{aligned}
\tag{36}
$$

$$
\begin{aligned}
\sum_{d=1}^{D}\sum_{n=1}^{N}\mathbb{E}_{q(z_{dn}),q(\theta_d)}[\log p(z_{dn}|\theta_d)] &= \sum_{d=1}^{D}\sum_{n=1}^{N}\sum_{k=1}^{K}\mathbb{E}_{q(z_{dn})}[z_{dn}^k]\mathbb{E}_{q(\theta_{dk})}[\log\theta_{dk}] \\
&= \sum_{d=1}^{D}\sum_{n=1}^{N}\sum_{k=1}^{K}\phi_{dn}^k\left(\Psi(\gamma_{dk}) - \Psi\left(\sum_{v=1}^{K}\gamma_{dv}\right)\right)
\end{aligned}
\tag{37}
$$

$$
\begin{aligned}
\sum_{d=1}^{D}\sum_{n=1}^{N}\mathbb{E}_{q(z_{dn}),q(\beta_{z_{dn}})}[\log p(w_{dn}|\beta_{z_{dn}})] &= \sum_{d=1}^{D}\sum_{n=1}^{N}\sum_{k=1}^{K}\sum_{\nu=1}^{W}w_{dn}^k\mathbb{E}_{q(z_{dn})}[z_{dn}^k]\mathbb{E}_{q(\beta_{k\nu})}[\log\beta_{k\nu}] \\
&= \sum_{d=1}^{D}\sum_{n=1}^{N}\sum_{k=1}^{K}\sum_{\nu=1}^{W}w_{dn}^k\phi_{dn}^k\left(\Psi(\lambda_{k\nu}) - \Psi\left(\sum_{y=1}^{W}\lambda_{ky}\right)\right)
\end{aligned}
\tag{38}
$$

And the entropies can be found on Wikipedia.

4.4   Question 4.19

The code is in appendix A.2.

5   BBVI

5.1   Question 5.20

We have the simple model:

$$X|\theta \sim \mathcal{N}(\theta, \sigma^2)$$
$$\theta \sim Gamma(\alpha, \beta) \tag{39}$$

With α, β and σ^2 known. Now, we will derive the gradient estimate w.r.t. ν without Rao-Blackwellization using one sample $z \sim q_\nu(\theta)$, $q_\nu(\theta) = LogNormal(\nu, \epsilon^2)$. We recall the formula:

$$\nabla_\lambda \mathcal{L} \approx \frac{1}{S} \sum_{s=1}^{S} \nabla_\lambda \log q(z_s|\lambda) \left(\log p(x, z_s) - \log q(z_s|\lambda) \right) \tag{40}$$

Where $z_s \sim q(z|\lambda)$. Therefore, here we have:

$$\nabla_\nu \mathcal{L} \approx \nabla_\nu \log q(z|\nu) \left(\log p(x, z) - \log q(z|\nu) \right)$$

$$\approx \nabla_\nu \log \left(\frac{\exp\left(-\frac{(\log\theta-\nu)^2}{2\epsilon^2}\right)}{\theta\epsilon\sqrt{2\pi}} \right) \left(\log \left(\frac{\exp\left(-\frac{(x-\theta)^2}{2\sigma^2}\right)}{\sigma\sqrt{2\pi}} \right) + \log \left(\frac{\beta^\alpha \theta^{\alpha-1} e^{-\beta\theta}}{\Gamma(\alpha)} \right) - \log \left(\frac{\exp\left(-\frac{(\log\theta-\nu)^2}{2\epsilon^2}\right)}{\theta\epsilon\sqrt{2\pi}} \right) \right)$$

$$\approx \nabla_\nu \left(-\frac{(\log\theta-\nu)^2}{2\epsilon^2} \right) \left(-\frac{(x-\theta)^2}{2\sigma^2} - \log\left(\sigma\sqrt{2\pi}\right) - \beta\theta + (\alpha-1)\log\theta \right.$$

$$\left. + \log\left(\frac{\beta^\alpha}{\Gamma(\alpha)}\right) + \frac{(\log\theta-\nu)^2}{2\epsilon^2} + \log\left(\theta\epsilon\sqrt{2\pi}\right) \right)$$

$$\approx \frac{\log\theta-\nu}{\epsilon^2} \left(\frac{(\sigma(\log\theta-\nu))^2 - (\epsilon(x-\theta))^2}{2\sigma^2\epsilon^2} + \log\left(\frac{\epsilon}{\sigma}\right) - \beta\theta + \alpha\log\theta + \log\left(\frac{\beta^\alpha}{\Gamma(\alpha)}\right) \right) \tag{41}$$

5.2   Question 5.21

Control variates in the Black Box Variational Inference (BBVI) paper are used for reducing the variance of gradient estimates in stochastic optimization by choosing functions with equivalent expectation but lower variance.

A Appendix

A.1 CAVI

Assignment 1.3 - CAVI

Consider the model defined by Equation (10.21)-(10-23) in Bishop, for which DGM is presented below:
Question 1.3.12:

Implement a function that generates data points for the given model.

```
In [ ]:  import numpy as np
         from scipy.stats import gamma, norm
         from scipy.special import psi
         from scipy.special import gamma as gamma_func
         np.random.seed(14)

         def generate_data(mu, tau, N):
           # Insert your code here
           D = np.random.normal(mu, np.sqrt(1/tau), N)

           return D
```

Set $\mu = 1$, $\tau = 0.5$ and generate datasets with size N=10,100,1000. Plot the histogram for each of 3 datasets you generated.

```
In [ ]:  MU = 1
         TAU = 0.5

         dataset_1 = generate_data(MU, TAU, 10)
         dataset_2 = generate_data(MU, TAU, 100)
         dataset_3 = generate_data(MU, TAU, 1000)

         # Visulaize the datasets via histograms
         # Insert your code here
         import matplotlib.pyplot as plt
         fig, axs = plt.subplots(1, 3, figsize=(12, 4))
         axs[0].hist(dataset_1, bins=20)
         axs[1].hist(dataset_2, bins=20)
         axs[2].hist(dataset_3, bins=20)
         plt.tight_layout()
         plt.savefig('../images/12_data.png')
         plt.show()
```

Question 1.3.13:

Find ML estimates of the variables μ and τ

```
In [ ]:  def ML_est(data):
             # insert your code
             N = len(data)
```

```
    x_mean = np.mean(data)
    x_var = np.var(data)

    tau_ml = 1 / x_var
    mu_ml = x_mean

    return mu_ml, tau_ml
```

Question 1.3.14:

What is the exact posterior? First derive it in closed form, and then implement a function that computes it for the given parameters:

```
In [ ]: def compute_exact_posterior(D, a_0, b_0, mu_0, lambda_0):
            # your implementation
            x_mean = np.mean(D)
            N = len(D)

            mu_prime = (lambda_0 * mu_0 + N * x_mean) / (lambda_0 + N)
            lambda_prime = lambda_0 + N
            a_prime = a_0 + (N-1)/ 2
            b_prime = b_0 + 0.5 * (np.sum(D**2) +
                                   lambda_0 * mu_0**2 - lambda_prime * mu_prime**2)

            exact_post_distribution = (a_prime, b_prime, mu_prime, lambda_prime)

            return exact_post_distribution
```

```
In [ ]: # prior parameters
        mu_0 = 0
        lambda_0 = 10
        a_0 = 20
        b_0 = 20
```

```
In [ ]: mus = np.linspace(-0.25, 1.1, 200)
        taus = np.linspace(0.4, 0.9, 200)

        fig, axs = plt.subplots(1, 3, figsize=(12, 4))
        for i, dataset in enumerate([dataset_1, dataset_2, dataset_3]):
          mu_ml, tau_ml = ML_est(dataset)

          a_T, b_T, mu_T, lambda_T = compute_exact_posterior(
              dataset, a_0, b_0, mu_0, lambda_0)

          Z_exact = np.zeros((len(mus), len(taus)))
          pTau = gamma(a=a_T, loc=0, scale=1/b_T)
          for j, tau in enumerate(taus):
              pMu = norm(loc=mu_T, scale=1/np.sqrt(lambda_T*tau))
              Z_exact[:, j] = pMu.pdf(mus) * pTau.pdf(tau)
          # Finding the maximum of the exact posterior
          mu_max_exact = mus[np.argmax(np.max(Z_exact, axis=1))]
          tau_max_exact = taus[np.argmax(np.max(Z_exact, axis=0))]
          # Plotting the results
          axs[i].contour(*np.meshgrid(mus, taus), Z_exact.T,
                         levels=5, colors=['green'])
          axs[i].plot(mu_max_exact, tau_max_exact, 'ro', label='MAP')
          axs[i].plot(mu_ml, tau_ml, 'b+', label='ML Estimate')
          axs[i].plot(MU, TAU, 'gx', label='Actual')
          axs[i].legend()
          axs[i].grid()
          axs[i].set_xlabel('mu')
          axs[i].set_ylabel('tau')
          axs[i].set_title('Exact posterior Dataset {}'.format(i+1))
        plt.tight_layout()
        plt.savefig('../images/14_contours.png')
        plt.show()
```
Question 1.3.15:

You will implement the VI algorithm for the variational distribution in Equation (10.24) in Bishop. Start with introducing the prior parameters:

Continue with a helper function that computes ELBO:

```
In [ ]: def compute_E_tau(a_N, b_N):
            E_tau = a_N / b_N

            return E_tau

        def compute_E_mu_2(mu_N, lambda_N):
            E_mu_2 = mu_N**2 + 1/lambda_N

            return E_mu_2

        def compute_E_log_tau(a_N, b_N):
            E_log_tau = psi(a_N) - np.log(b_N)

            return E_log_tau
```

```
In [ ]: def compute_elbo(D, a_0, b_0, mu_0, lambda_0, a_N, b_N, mu_N, lambda_N):
            N = len(D)
            x_mean = np.mean(D)
            x_2_sum = np.sum(D**2)
            E_tau = compute_E_tau(a_N, b_N)
            E_mu_2 = compute_E_mu_2(mu_N, lambda_N)
            E_log_tau = compute_E_log_tau(a_N, b_N)

            # compute the elbo
            # E[log p(D|mu, tau)]
            E_log_p_D = N/2 * E_log_tau - 0.5*E_tau * (x_2_sum - 2*N*x_mean*mu_N + N*E_mu_2)

            # E[log p(mu, tau)]
            E_log_p_mu_tau = (a_0-0.5)*E_log_tau - b_0*E_tau - 0.5*lambda_0*E_tau*(E_mu_2 + mu_0**2 - 2*mu_0*mu_N)

            # Entropy of mu
            entropy_mu = norm.entropy(loc=mu_N, scale=1/np.sqrt(lambda_N))
            # Entropy of tau
            entropy_tau = gamma.entropy(a=a_N, scale=1/b_N)

            elbo = E_log_p_D + E_log_p_mu_tau + entropy_mu + entropy_tau

            return elbo
```

Now, implement the CAVI algorithm:

```
In [ ]: def CAVI(D, a_0, b_0, mu_0, lambda_0, iter=5):
            # make an initial guess for the expected value of tau
            E_tau = 1

            N = len(D)
            x_mean = np.mean(D)
            x_2_sum = np.sum(D**2)

            # Constants
            a_N = a_0 + (N+1) / 2
            mu_N = (lambda_0 * mu_0 + N * x_mean) / (lambda_0 + N)
            E_mu = mu_N

            # Variables
            b_Ns = []
            lambda_Ns = []

            # ELBO
            elbos = []

            # CAVI iterations ...
            for i in range(iter):
                # update the values for the variational parameters
                lambda_N = (lambda_0 + N) * E_tau

                E_mu_2 = compute_E_mu_2(mu_N, lambda_N)
                b_N = b_0 + 0.5 * (x_2_sum + N*E_mu_2 - 2*N*E_mu*x_mean + lambda_0*(E_mu_2 - 2*E_mu*mu_0 + mu_0**2))

                E_tau = compute_E_tau(a_N, b_N)

                b_Ns.append(b_N)
                lambda_Ns.append(lambda_N)
                # save ELBO for each iteration, plot them afterwards to show convergence
                elbos.append(compute_elbo(D, a_0, b_0, mu_0, lambda_0, a_N , b_N, mu_N, lambda_N))

            return a_N, b_N, mu_N, lambda_N, elbos, b_Ns, lambda_Ns
```

Run the VI algorithm on the datasets. Compare the inferred variational distribution with the exact posterior and the ML estimate. Visualize the results and discuss your findings.

```
In [ ]:  def compute_z_exact(mus, taus, a_, b_, mu_, lambda_):
             z = np.zeros((len(mus), len(taus)))
             pTau = gamma(a=a_, loc=0, scale=1/b_)
             for j, tau in enumerate(taus):
